

Reboring Pulleys

Occasionally it may be necessary to rebore a pulley for an unusually large shaft. This is generally not a problem with a good machine shop and the pulley is bored within the hub dimension. Of course, adequate material should be left for strength purposes. A means of attaching the pulley to the shaft will be needed, such as bolting to a plate, etc. It is not recommended to rebore into the arms of a pulley since internal stresses will be relieved possibly causing warpage and premature failure.
